Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N_Geneseq_101002:*

                                                                                                                                                                                                                                                                                                                                                                      The present sequence encodes a human DNA fragmentation factor subunit of 40 kDa, designated DFF40. The specification also describes DFF45. DFF40 is capable of inducing apoptosis, and may contain a nuclear localisation fragment. DFF45 acts as a molecular chaperone to direct the folding of DFF40. Although all DNase activity is associated with DFF40, DFF activity only occurs once DFF40 is complexed with DFF45. The DFF polypeptides and polynucleotides are useful for inhibiting the growth of cancer cells, and for inducing apoptosis of cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wang
                                                                                                                                                                                                                                                                                                                                                          Sequence 2839
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 18; Page 44-45;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New DNA fragmentation factor polypeptides and polynucleotides, useful for inhibiting the growth of cancer cells, as well as for inducing apoptosis of cells -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-DEC-2000;

DFF is a heterodimeric protein comprising 40KDa and 45KDa subunits. DFF45 acts as a molecular chaperone to facilitate the appropriate folding of DFF40 and acts as an inhibitor for DFF40. DFF40 and DFF45 are used in gene therapy. The modulators of human DFF40 activity are useful for inducing apoptosis and for treating hyperproliferative disorders such as restensis, psoriasis, metastatic tumours, angiogenesis and benign and malignant neoplasias. They are also used for treating cancers of the brain (glioblastoma, astrocytoma, oligodendroglioma and ependymoma), lung, liver, spleen, kidney, lymph node, pancreas, small intestine, blood cells, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone marrow, blood, other tissue and multi-drug resistant cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying modulator of human DNA fragmentation factor 40, for treating cancer, involves contacting cell or cell-free composition comprising DFF40 with candidate substance and comparing apoptosis with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 2839 BP; 644 A; 701 C; 755 G; 739 T; 0 other;

```

The present sequence encodes a caspase activated nuclease (CPAN). Active CPAN proteins can be used for identifying compounds which inhibit apoptosis. Inhibitors of apoptosis can be used therapeutically, e.g. where cells are damaged and the apoptotic pathway is initiated such as by heart attack or stroke. The inactive CPAN proteins can be used for

                        The present sequence encodes a human DNA fragmentation factor, designated DFF40. Also described are: (1) a method of inducing apoptosis in a cell comprising providing the cell with DFF40 which results in apoptosis; (2) a method for inhibiting the growth of a cancer cell comprising contacting a cancer cell with a DNA fragmentation factor designated DFF40 under conditions permitting the uptake of the DNA fragmentation factor by the cell where the presence of the DFF40 into the cell induces apoptosis; (3) a method for treating cancer comprising: (a) encoding a DFF40 DNA fragmentation factor, and (b) a promoter active in the tumour cell, where the promoter is operably linked to the region encoding the DNA fragmentation factor, under conditions permitting the uptake of the nucleic acid by the tumour cell; (4) a method of identifying a modulator of DFF40; and (5) a method of producing a functional DNA fragmentation factor. An expression construct encoding a DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. The expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor. An expression construct encoding a C DNA fragmentation factor.

Two ICAD's are specifically claimed: a long chain form (ICAD-L) and a shorth chain form (ICAD-S). ICAD and ICAD can be used in the prevention of cell death, and can be used as a research reagent for cell death. The present sequence encodes mouse CAD which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 1999-554024/47.

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO000010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities,
                                                                                             Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune disorders -

CC comprising the sequences given in ARXI2532 to ARXI779. Also described is CC a method of detecting differentially expressed genes correlated with the CC cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, and CC mapping, tissue typing or profiling, forensics, genetic analysis and CC can be used for raising antibodies for experimental, diagnostic and CC therapeutic purposes. The polynucleotides may also be used to construct CC arrays for diagnostics (which may be used to determine function of an CC two cells (e.g. to identify abnormal or diseased tissue in a human, to CC cancer). The polynucleotides of the susceptibility to a disease such as CC cancer). The polynucleotides of the invention are especially used in the CC cancer). The polynucleotides of the invention are especially used in the CC cancer). The polynucleotides of the invention are especially used in the CC cancer). The polynucleotides can also be used to screen for CC peptide analogues and annagement of colorectal cancer, breast cancer, CC and lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 10
